Use of modulators of activity of 3700 protein for making medicament for e.g., modulating protein phosphorylation or cell signaling, or for treating or preventing cellular proliferative and/or differentiative Curtis 2002-352007/38 RAJ, AAU79652 Galvin ₹

Claim 28; Fig 1; 115pp; English.

The present invention relates to the isolation of a novel human protein ckinase designated 3700, and the polynucleotide sequence encoding it. The clinvention also describes the use of a modulator of the activity of protein kinase (PK) 3700 for making a medicament or pharmaceutical cc composition for modulating the ability of a cell to phosphorylate an cc amino acid residue of a substrate protein. Modulators of protein kinase cc 3700 activity are useful for modulating protein phosphorylation, cell cs signalling, tumourigenesis, mitogenesis, transcription of a gene, c angiogenesis, tissue repair, tissue regeneration, establishment or c progression of atheroselerosis, and signalling across the blood-brain caprosesion of atheroselerosis, and signalling across the blood-brain compression of atheroselerosis, and signalling across the blood-brain cr progression of atheroselerosis, and signalling across the blood-brain compression as diagnostic targets and therapeutic agents for c prognosticating, diagnostic targets and therapeutic agents for c curing pK-related disorders and cellular proliferative and/or c differentiative disorders (e.g. haematopoietic neoplastic disorders, c carcinoma, sarcoma, metastatic disorders or leukaemia). The 3700 c detect a genetic alteration in a 3700 gene, in chromosome mapping, for tissue typing, in forensic biology, and as surrogate markers. The present xx

The nucleic acid molecules and polypeptides are also useful as modulating agents in regulating a variety of cellular process, e.g. cell proliferation, differentiation, growth addivision. This sequence encodes a novel human protein of the invention. Note: The sequences given in the specification are also available in electronic format from electronic format from ttp.seqdata.uspto.gov/sequence.html?DocID=20040058355.

INCYTE GENOMICS INC

2002-090207/12. DB; AAE16266.

New polypeptides, useful for diagnosing, treating or preventing disorders of growth and development, cardiovascular and lipid, and diseases such as cancer, comprise human kinase polypeptides.

Claim 5; Page 184; 197pp; English.

The invention relates to human kinase PKIN proteins and their corresponding cDNAs. A composition containing PKIN agonist is useful for CC treating a disease or condition associated with decreased expression of PKIN and a composition comprising PKIN antagonist is useful for treating CC disorders include cancer (leukaemia, adenocarcinoma, lymphoma, melanoma, CC myeloma, sarcoma, teratocarcinoma, Hodgkin's disease); immune disorder (Acquired Immune Deficiency Syndrome (AIDS), asthma, Addison's disease, CC atherosclerosis, anaemia, allergies, adult respiratory distress syndrome, CC autoimmune thyroiditis, gout, bronchitis, Crohn's disease, diabetes CC mellitus, multiple sclerosis, Good pasture's syndrome, Graves' disease, CC osteoarthritis, osteoporosis, pancreatitis, psoriasis, Reiter's syndrome, CC remematoid arthritis, Sjogren's syndrome, uveitis, ulcerative colitis, CC bacterial, parasitic, fungal, viral, protozoal and helminthic infections) CC growth and development disorders (arteriosclerosis, cirrhosis, hepatitis, CC ushing's syndrome, hypothyroidism, cerebral palsy, cataracts); cardio CC vascular disease (arteriovenous fistula, hypertension, vasculitis, CC ischaemic heart disease, chronic bronchitis, lung tumours); lipid CC disorder (fatty liver, Fabry's disease, Niemann-Pick's disease,

Primers for synthesising the full length cDNA are useful for clarifying the function of the protein encoded by the cDNA. The full length clones were obtained by construction of full length enriched cDNA libraries that were synthesised by the oligo-capping method. The primers enable the production of the full length cDNA easily without any special methods. The present sequence is a full length human cDNA of the invention. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in CD-ROM format directly
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Sequence 3395
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Claim 8;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           830 Primers useful for synthesizing in genetic manipulation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               08-JUL-1999;

This invention relates to a novel primers useful for synthesising full length cDNA molecules that encode human proteins. Specifically, it refer to secretory or membrane proteins that are potential therapeutic agents/ target molecules in the field of medicine, and in particular genes encoding proteins that are associated with signal transduction, glycoproteins and transcription. The present invention describes a metho

The invention relates to cancer-associated proteins (CAP) and the cancer-cassociated (CA) nucleic acids encoding them. The invention also relates to associated (CA) nucleic acids encoding them. The invention also relates contacting for treating cancers involving administering to a patient an individual contacting and a method of screening for anticancer activity in a contacting a tissue sample derived from a cancer cell with an anticancer contacting a tissue sample derived from a cancer cell with an anticancer drug candidate and monitoring the effect of the anticancer drug candidate con expression of the CA gene. The CAP proteins are useful for detecting cancer associated with expression of a CAP protein in a test cell sample cancer associated with expression of a CAP protein in a test cell sample cancer, involving determining the expression of a CA nucleic acid in a cissue. This sequence represents human CA cDNA of the invention. Note: The sequence data for this patent did not form part of the printed contaction, but was obtained in electronic format directly from WIPO cat ftp.wipo.int/pub/published_pct_sequences

Example ۲, SEQ IJ ö 11; 366pp; English.

This invention relates to a novel isolated, enriched or purified nucleic acid molecule that encodes a kinase polypeptide. Specifically, it relates to human tyrosine and serine/threonine protein kinases (PTK's and STK's), as well as protein kinase-like enzymes. The present invention describes screening methods to identify agonists, antagonists and antibodies that can be used to modulate the activity or function of the mammalian kinase enzymes. As such, these compositions can be used for gene therapy purposes to treat diseases or disorders including cancer, immune-related diseases, cardiovascular disease, brain or neuronal associated disease, metabolic and inflammatory disorders. Accordingly, they exhibit cytostatic, neuroprotective, immunomodulator and antiinflammatory activities. This polynucleotide sequence is a human kinase DNA sequence of the invention.

                                                                                                                                                                                                                               protein or complementary sequences. The polynucleotides are useful for identifying expressed genes or for physical mapping of human genome. The encoded polypeptides (ABP68902-ABP69849) are useful as molecular weight markers, as a food supplement, for generating antibodies, in medical imaging, screening and diagnostic assays and for treating cellimaging, autoimmune diseases (Markinson's or Alzheimer's disease), autoimmune diseases (multiple sclerosis, diabetes, lupus) genetic disorders, myeloid or lymphoid disorders, platelet or coagulation disorders, wound, burns, incision, ulcers, liver or lung fibrosis, infections (bacterial, viral, fungal, parasitic), arthritis, etc. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Human; genome mapping; gene therapy; food supplement; virus; fungus; cell-proliferative disorder; neurodegenerative disease; bacterial; Parkinson's disease; Alzheimer's disease; autoimmune disease; multiple sclerosis; diabetes; genetic disorder; wound; burn; infecti arthritis; cytostatic; immunomodulator; nootropic; neuroprotective; antiparkinsonian; antidiabetic; immunosuppressive; dermatological; haemostatic; vulnerary; fungicide; antibacterial; virucide; protozoo

The invention relates to an isolated polynucleotide. The methods and compositions of the present invention are useful for the diagnosis and/or treatment of diseases or conditions associated with aberrant expression or activity of the arginine-rich protein-like polypeptides, such as cancer and inflammation. They can also be used in forensics, gene mapping, identification of mutations responsible for genetic disorders, and in assessing biodiversity. The present sequence represents a novel human arginine-rich protein cDNA.
                                                                                                                                                                                                 New isolated arginine-rich protein-like polynucleotides and useful for diagnosing and/or treating conditions associated activity of the arginine-rich polypeptides, such as cancer activity
                                                                                                                                                                                                                                                                                        Tang

The polynucleotides of the invention and antibodies encoded by them may be used in the prevention, diagnosis and treatment of diseases associated with inappropriate polypeptide expression. The products of the invention may also be used to identify modulators of expression and activity and to down regulate expression and activity. The antibodies of the invention may also be used as diagnostic agents for detecting the presence of polypeptides in samples. This sequence encodes a polypeptide described in the disclosure of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Homo
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Nucleic acids having the sequences of clones isolated from libraries different human tissues, useful in recombinant DNA methodologies.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             WPI; 2001-327840/34.

edigastica est ellipation

New PRO polypeptides, useful for diagnosing and treating an immune related disorder, e.g. systemic lupus erythematosus, rheumatoid arthritis, osteoarthritis, juvenile chronic arthritis, thyroiditis mellitus. õ 밁 S

Claim 2; SEQ ID NO 639; 918pp; English

is often transmitted by secreted polypeptides (for example mitogenic factors, survival factors, cytotoxic factors, differentiation factors, neuropeptides and hormones) which are received and interpreted by diverse cell receptors or membrane bound proteins. These membrane bound proteins and receptors may be of use as pharmaceutical and diagnostic agents, such as in the blocking of receptor-ligand interactions. The current invention provides the amino acid sequences of novel human membrane bound receptors and proteins, along with the cDNA sequences encoding them. The novel proteins of the invention may have cytostatic activities through the etimulation of chondrocytes. The nucleic acids of the invention may be useful for the manufacture of a medicament for diagnosing or treating a tumour in a mammal. In addition, they may be useful for measuring or detecting the expression of a tumour associated gene. The present recent of a cDNA sequence which encodes a human PRO protein of the This invention relates to novel nucleic acids encoding human PRO secrete and transmembrane proteins. Extracellular proteins play important roles in the formation, differentiation and maintenance of multicellular organisms. The fate of many individual cells (for example proliferation, migration received n or differentiation) is typically governed by information from other cells and the immediate environment. The information PRO secreted

                            Submitted (15-NOV-2002) Human Genome Sequencing Center, Department of Molecular and Human Genetics, Baylor College of Medicine, One Baylor Plaza, Houston, TX 77030, USA On Nov 15, 2002 this sequence version replaced gi:23269681. The sequence in this assembly is a combination of BAC based reads and whole genome shotgun sequencing reads assembled using Atlas (http://www.bgsc.bcm.tmc.edu/projects/rat/). Each contig described in the feature table below represents a scaffold in the Atlas assembly (a 'contig-scaffold'). Within each contig-scaffold,
